PRODUCT DESCRIPTION

The Photon sieve is simply THE most advanced diffraction lens known to mankind today. It's also an astonishing, counter-intuitive object that will sure to put a perplexed and thrilled smile on everyone's face.

This mirror is made from pure copper on a glass fibre and epoxy resin substrate and is coated with red epoxy resin. The copper geometry has been manufactured with extreme precision (2.5/100 mm) and tailored to the specific frequency of our apparatuses.
